

Segmentation and Annotation Guidelines for the DAASI corpus

Sentence segmentation. Documents were segmented by the two annotators following these rules:

1. Split at sentence-final punctuation (periods, question marks) and at semicolons introducing an independent clause.
2. Keep list items introduced by a shared stem together with that stem as a single segmentation unit, rather than splitting mid-list (e.g., a sentence followed by an enumerated list of required documents is kept as one unit if the list items are not independently comprehensible without the stem).
3. Exclude non-sentential content – form field labels, headers, and tables of numeric values – prior to segmentation, since these do not constitute simplifiable sentences.
4. Abbreviations and numbered references (e.g., article/paragraph numbers) are not treated as sentence boundaries.

Accept / revise / reject guideline for GPT-4o drafts. For each candidate simplification produced in the automatic-draft stage (see the prompt document), annotators applied the following decision rule:

- **Accept** if the simplification preserves all factual content (names, dates, numbers, deadlines) and is grammatically correct, natural Arabic that a non-specialist reader would understand more easily than the original.
- **Revise** if the simplification is directionally correct (simpler, meaning preserved) but contains an error correctable with a minor edit – e.g., an unnatural word choice, an omitted number, or an overly literal rendering of an idiomatic bureaucratic phrase.
- **Reject** if the simplification changes the meaning, drops required factual content, or fails to simplify the sentence at all; rejected pairs were either regenerated from a revised prompt or discarded from the corpus.
- Disagreements between the two annotators on any of the above were referred to a third independent annotator, whose decision was final.
