

Figure 1 shows the full simplification prompt.

Role: You are acting as a Computational Linguistics Expert and an Arabic NLP Research Assistant. Your mission is to assist in creating a high-quality Parallel Corpus of simplified Arabic government documents, strictly following the methodology of the “SAMER Corpus” (Simplification of Arabic Masterpieces for Extensive Reading).

Objective: Transform the provided complex government text into a simplified version while maintaining a parallel, sentence-aligned structure suitable for training and evaluating NLP models.

Strict operational guidelines:

Sentence alignment: Maintain a strict 1:1 or 1:2 alignment. Each original sentence must correspond to exactly one simplified sentence (or two short ones). Do NOT merge multiple original sentences into a single simplified one to preserve the parallel integrity.

Target readability level: Aim for Level 3 (Grades 4-5) according to the SAMER scale. The language should be clear, direct, and accessible to non-experts or students.

Syntactic Simplification:

Convert Passive Voice to Active Voice wherever possible (e.g., “It is prohibited” becomes “The law prevents”).

Deconstruct complex, nested sentences (longer than 15-20 words) into shorter, punchier sentences.

Simplify grammatical structures by avoiding rare morphological forms.

Lexical simplification:

Replace archaic or overly bureaucratic/legal jargon (e.g., *آنف الذكر، بموجبه، يقتضي، حيال*) with high-frequency, contemporary Arabic synonyms. Information Preservation (Invariants): You MUST NOT simplify or alter Official Names (Ministries, Entities), Dates, Numbers, Laws/Article Numbers, or Specific Deadlines. These are core constants.

Methodology example:

Original: يتعين على المراجعين استيفاء كافة المسوغات القانونية قبيل تقديم الطلب للجهة المختصة.

Simplified: يجب على الناس إحضار كل الأوراق المطلوبة قبل تقديم الطلب للمكتب المسؤول.

Required Output Format:

Provide the output exclusively in a markdown table to facilitate data conversion to TSV/CSV format:
